

Nasij Estimate Documents

This folder contains the research-backed strategy and estimate package for Nasij, plus a script to convert markdown documents to PDF.

Folder Layout

```
estimate/  
  assumptions.md  
  bmc.md  
  business-plan.md  
  empathy-card.md  
  glossary.md  
  pestel.md  
  porter.md  
  services.md  
  sources.md  
  README.md  
  scripts/  
    build_pdfs.ps1  
  pdf/  
    *.pdf
```

Document Set

Core publishable docs (default PDF build target):

- business-plan.md
- bmc.md
- porter.md
- pestel.md
- empathy-card.md

Supporting docs:

- services.md
- assumptions.md
- sources.md
- glossary.md

Citation Contract

- External and factual claims use source citations: [Sxx](./sources.md#sxx).
- Model and forecast values use assumptions citations: [Axx](./assumptions.md#axx).
- Every Sxx must exist in sources.md; every Axx must exist in assumptions.md.

PDF Build Script

Script path:

- scripts/build_pdfs.ps1

Dependencies:

- Microsoft Word desktop (COM automation)
- Python with markdown package (pip install markdown)

Stable interface:

```
.\build_pdfs.ps1 -InputDir <path> -OutputDir <path> [-AllMarkdown] [-Files <list>]
```

Usage Examples

Run from nasij/docs/estimate/scripts.

1) Default conversion (core 5 docs to ../pdf):

```
.\build_pdfs.ps1
```

2) Convert all markdown files in estimate folder:

```
.\build_pdfs.ps1 -AllMarkdown
```

3) Convert specific files:

```
.\build_pdfs.ps1 -Files business-plan,porter,sources
```

4) Custom input/output paths:

```
.\build_pdfs.ps1 -InputDir "D:\path\to\estimate" -OutputDir "D:\path\to\estimate\pdf"
```

Naming Rules

- Keep markdown filenames lowercase with hyphen separators.
- PDF filenames follow markdown basenames exactly.
- Example: business-plan.md -> business-plan.pdf

Troubleshooting

- **Word COM unavailable:**
- Install Microsoft Word desktop edition and retry.
- The script fails fast with a clear error when COM cannot be instantiated.
- **Python markdown package missing:**
- Install dependency with python -m pip install markdown.
- The script fails with a conversion error if markdown rendering is unavailable.

- **Missing core file error:**
- Ensure all default core docs exist in the input directory.
- **Wrong output location:**
- Pass an explicit -OutputDir and verify the path exists or is creatable.
- **Formatting differences across machines:**
- Word rendering can vary by installed fonts and Office version; keep style checks in final QA.
