

Nasij Services Overview

Nasij is modeled as a traceability-first operational platform for the wool value chain, with collection as the primary control point and end-to-end continuity across depot, wash, transformation, and commercialization [S01](#), [S19](#).

1. Collection Services (Priority Layer)

1.1 Structured Collection Intake

- Digitize source declarations by actor type (C1/C2/C3) with mission scheduling and minimum required metadata.
- Capture collection events with geotag, timestamps, and operator identity.
- Apply QR-based lot identity immediately at intake to preserve downstream continuity [S19](#).

1.2 Weight Capture and Reconciliation Trigger

- Capture gross field weight at collection.
- Reconcile against declaration expectations and push alert workflows when variance exceeds policy thresholds.
- Continue operations while preserving the corrected measured value as canonical for the next stage [S19](#).

2. Depot Services (D1)

2.1 Intake Verification and Re-weigh

- Scan inbound lot QR.
- Re-weigh and compare against collection value.
- Produce discrepancy flags and escalation tickets where needed.

2.2 Primary Sorting and Pre-clean

- Record contaminant removal and update lot state from D0 to D1.
- Store per-lot handling notes needed for wash-stage planning.

3. Wash Services (D2)

3.1 Wash Stage Recording

- Register wash completion by lot.
- Capture post-wash weight and quality checkpoints.
- Update state to D2 with auditable operator and timestamp metadata.

3.2 Yield and Loss Visibility

- Quantify D1->D2 mass variation per lot and per period.
- Detect abnormal loss patterns early for process correction.

4. Transformation Services (D3/D4)

4.1 Transformation Input/Output Ledger

- Register D2 input lots entering transformation.
- Record output classification and commercial destination (D3 / D4).
- Maintain lot lineage to support buyer confidence and quality evidence [S01](#).

4.2 Commercial Readiness Pack

- Export per-lot history and key quality/weight events.
- Provide batch-level compliance and discrepancy history for downstream sales and governance.

5. Platform Services

5.1 Role-based Mobile Operations

- Mobile-first experience for field and source actors is justified by strong cellular adoption and internet penetration [S06](#), [S07](#), [S11](#), [S12](#).

5.2 Offline-first Capture and Sync

- Local-first recording for low-connectivity conditions, then queued synchronization.
- Prioritized for field contexts where rural and logistics constraints can interrupt real-time operations [S08](#), [S15](#), [S20](#).

5.3 Alert and Control Tower

- Standardized anomaly types (mass variance, missing handoff, delayed progression).
- Central dashboard for unresolved risk events and operational bottlenecks.

6. Governance and Compliance Services

6.1 Data Protection Controls

- Consent-aware data collection, role-based access, and traceable processing logs aligned with Law 18-07 obligations [S16](#), [S17](#).

6.2 Audit and Accountability

- Immutable event trails for lot progression and operator actions.
- Periodic compliance review process linked to the national authority context [S18](#).

7. Revenue-linked Service Lines (Estimate Model)

- Per-kg traceability/processing service fees [A08](#).
- Pickup/logistics mission fees [A09](#).
- Discrepancy exception handling fees [A10](#).
- Optional advanced analytics and partner reporting packages (modeled in business plan) [A31](#).

Revenue logic and 5-year projections are detailed in [business-plan.md](#).
